Build Angular + Node.js Express + MySQL Application

Procedure:

Phase-I: Create and Build Front-end Angular Application

1. Create Website (HTML, CSS and JavaScript)

OR

Download Free Website Template

- 2. Convert Website to Angular Application
- 3. Create Single Page Application

Phase-II: Create and Build MySQL Database

Phase-III: Create and Build Node.js Express (Web Server) Application

Phase-IV: Integrate Front-End with Web Server Application

- 1. Create Http Service and Build Methods
- 2. Consume Methods of Http Service
- 3. Apply Data Binding (.ts to .html)

Phase-I: Convert Website Design to Angular Project

Procedure:

- 1. Download Free Website Template (e.g., https://www.free-css.com)
- 2. Create Angular Project with Routing Option
 - ng new demo 14072022
- 3. Install and Configure Bootstrap
 - npm install bootstrap -save
 - Copy Reference Paths of bootstrap.min.css and bootstrap.min.js files in angular.json

```
"styles": [
    "src/styles.css",
    "node_modules/bootstrap/dist/css/bootstrap.min.css"
],
"scripts": [
    "node_modules/bootstrap/dist/js/bootstrap.min.js"
]
```

- 4. Copy Header Content in index.html
- 5. Copy Body Content in app.component.html
- 6. Copy CSS files into assets/css folder
- 7. Copy images into assets/images folder
- 8. Change Image Path wherever required in app.component.html
- 9. Run Angular Project

Creating Single Page Application (SPA)

Procedure:

- Create Custom Components: home, category, product, deal and contact ng g c [component name]
- 2. Create Links in app.component.html and Configure Route Path in app-routing.module.ts
- 3. Add <router-outlet></router-outlet> tag in app.component.html
- 4. Cut and copy relevant content from app.component.html to corresponding components
- 5. Create Dynamic Content in product.component.html

(Modify first product box and remove all other 7 boxes)

```
<div class="box" *ngFor = "let item of products">
            <span class="discount">{{item.discount}}</span>
            <div class="icons">
                <a href="#" class="fas fa-heart"></a>
                <a href="#" class="fas fa-share"></a>
                <!-- <a href="#" class="fas fa-eye"></a> -->
            </div>
            <img src="assets/images/{{item.image}}" alt="">
            <h3>{{item.name}}</h3>
            <div class="stars">
                <i class="fas fa-star"></i></i></or>
                <i class="fas fa-star"></i></i>
                <i class="fas fa-star"></i></i>
                <i class="fas fa-star"></i></i>
                <i class="fas fa-star-half-alt"></i></i></or>
            </div>
            <div class="price"> {{item.discount price}} <span>
{{item.original price}} </span> </div>
            <div class="quantity">
                <span>quantity : </span>
                <input type="number" min="1" max="1000" value="1">
                <span> /kg </span>
            <a href="#" class="btn">add to cart</a>
        </div>
```

6. Add Declaration with Data in product.component.ts

Phase-II: Create and Build Grocery Store Database (MySQL)

Procedure:

- 1. Download, Install and Open MySQL Workbench
- 2. Connect MySQL workbench

UserId: root

Password: mysql

- 3. Create New Schema (Database): store
- 4. Create Table: Products

Fields: ProductNo, Name, OriginalPrice, DiscountPrice, ImagePath

5. Insert Record (Product Data)

Phase-III: Create Node.js Express Application

Procedure:

- 1. Create Node Project Folder.
- 2. Go to Project Folder and type code . command to open project in VS Code
- 3. Generate package.json:

```
npm init -y (to create node workspace/ to setup node project)
```

4. Installing Express.js and its Dependencies:

```
npm install express – Web Framework
```

5. Create index.js file and Write "Hello World" JavaScript Code

```
var express = require('express');
var app = express();

// Default Route
app.get('/', function (req, res) {
    res.send('<h1>Hello World</h1>');
})

// set port, listen for requests
const PORT = process.env.PORT || 8080;
app.listen(PORT, () => {
    console.log(`Server is running on port ${PORT}.`);
});
```

- 6. Run Project: node index.js
- 7. Open Browser and type NodeServer URL:

localhost:8080

8. Implement Cross-Origin Resource Sharing (CORS)

```
var cors = require('cors');
const corsOptions ={
    origin: "*",
    methods: "GET,HEAD,PUT,PATCH,POST,DELETE",
    Headers: "Origin, X-Requested, Content-Type, Accept
Authorization",
    optionSuccessStatus:200
}
app.use(cors(corsOptions));
```

8. Create GetProducts Method and Connect MySQL Database

```
• Install MySQL Library
   npm install mysql
• Import MySQL Library
   var mysql = require('mysql')
• Create Connection
   var connection = mysql.createConnection({
     host: 'localhost',
     user: 'root',
     password:'mysql',
     database:'store'
   });
• Create Method
   app.get("/products", function(req , res){
   connection.query("SELECT * FROM store.products", function (err,
   data) {
         if (err) return next(new AppError(err, 500));
             res.status(200).json({
             status: "success",
             length: data?.length,
             data: data,
         });
```

9. Open Browser. Type localhost:8080/products

}); });

Phase-IV: Add Http Service Class to Existing Angular Application

Procedure:

```
1. Create Service Component
   ng g s product
2. Import HttpClientModule in app.module.ts
   import { HttpClientModule } from '@angular/common/http';
3. Add GetProducts method in product.service.ts
   import { Injectable } from '@angular/core';
   import { Observable, throwError } from 'rxjs';
   import { HttpClient } from '@angular/common/http';
   @Injectable({
     providedIn: 'root'
   })
   export class ProductService {
     constructor(private http: HttpClient) { }
     url:string = "http://localhost:8080/products";
     GetProducts(): Observable<any> {
       return this.http.get<any>(this.url)
   }
```

Consume Http Method of Angular Service

```
(Call GetProducts method from product.component.ts)
import { Component, OnInit } from '@angular/core';
import { ProductService } from '../product.service';
@Component({
  selector: 'app-product',
 templateUrl: './product.component.html',
 styleUrls: ['./product.component.css']
})
export class ProductComponent implements OnInit {
 constructor(
    private productService:ProductService
  ) { }
 ngOnInit(): void {
   this.GetProducts();
 }
 products = [
    {
      "ImageName" : "product-1.png",
      "Name" : "organic banana",
      "OriginalPrice": 10,
      "DiscountPrice": 8
    }
  1
 GetProducts(){
  return this.productService.GetProducts().subscribe((response: {}) => {
    let data: any = response;
 console.log(data.data);
this.products = data.data;
  });
}
```

Apply Data Binding

(product.component.ts to product.component.html)

```
<section class="product" id="product">
    <h1 class="heading">latest <span>products</span></h1>
    <div class="box-container">
        <div class="box" *ngFor = "let item of products">
            <span class="discount">{{(item.DiscountPrice -
item.OriginalPrice) *100 / item.OriginalPrice | number: '2.1-2'}} %</span>
            <div class="icons">
                <a href="#" class="fas fa-heart"></a>
                <a href="#" class="fas fa-share"></a>
                <a href="#" class="fas fa-eye"></a>
            </div>
            <img src="assets/images/{{item?.ImageName}}" alt="">
            <h3>{{item?.Name}}</h3>
            <div class="stars">
                <i class="fas fa-star"></i></i>
                <i class="fas fa-star"></i></i>
                <i class="fas fa-star"></i></i>
                <i class="fas fa-star"></i></i>
                <i class="fas fa-star-half-alt"></i></i>
            </div>
            <div class="price"> {{item?.OriginalPrice | currency: "INR"}}
<span> {{item?.DiscountPrice | currency: "INR"}} </span> </div>
            <div class="quantity">
                <span> quantity : </span>
                <input type="number" min="1" max="1000" value="1">
                <span> /kg </span>
            </div>
            <a href="#" class="btn">add to cart</a>
        </div>
   </div>
  </section>
```
